# LISN in the Greater Paris Area

# LISN: An Interdisciplinary Laboratory for Digital Sciences

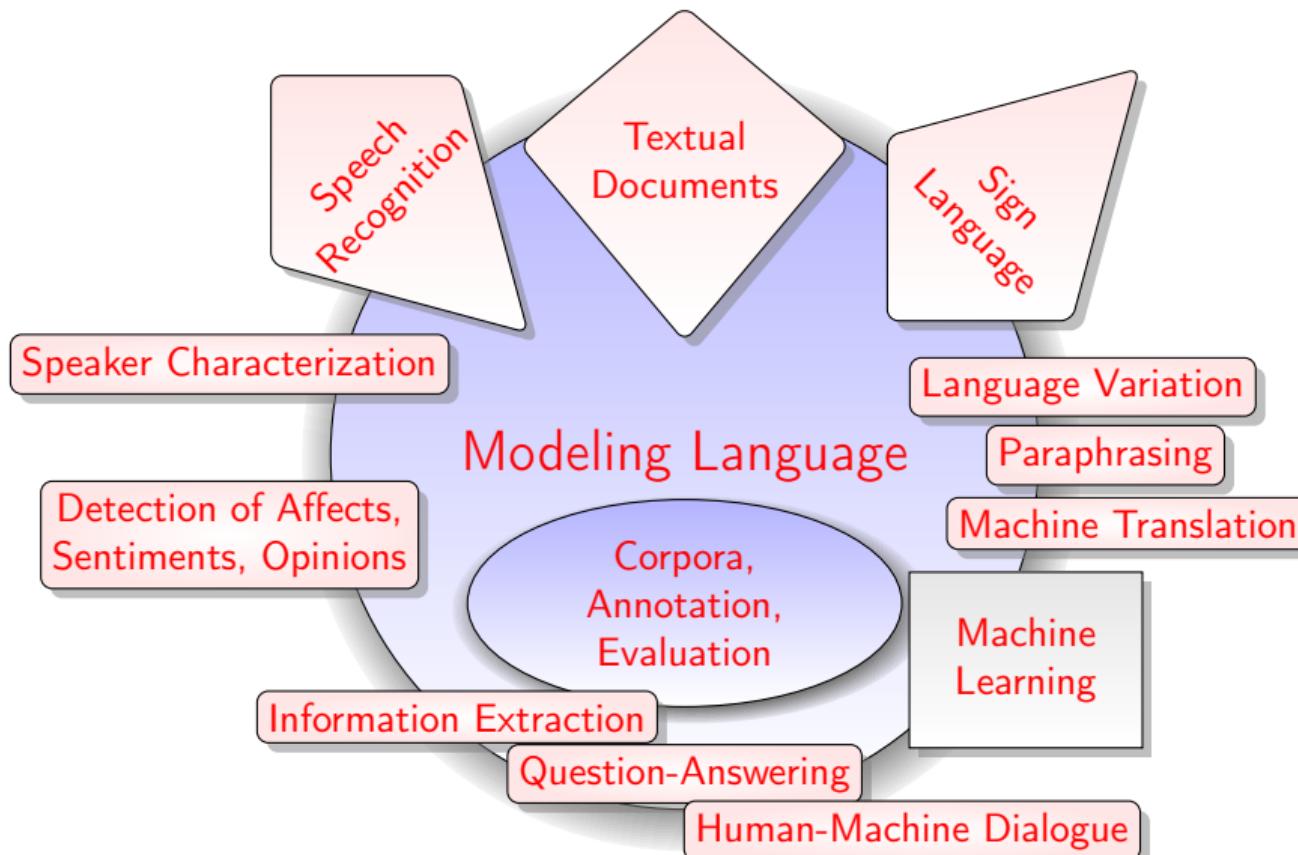

<https://www.lisn.upsaclay.fr/>

A joint **CNRS** Research Unit on the **Université Paris-Saclay** Campus: Belvédère buildings

# LISN's Language Sciences and Technologies Department

2 teams, about 70 people including 28 permanent researchers

# Natural Language Processing of Biomedical Text

Biomedical texts convey information and knowledge

- Natural Language Processing of these texts unlocks that information and knowledge for further computer processing

Overall approach

- Supervised machine learning
- Self-supervised word representations
- Make use of rich pre-existing knowledge in the medical domain:
  - terminologies, ontologies

## Multiple needs

- Health care professionals
  - Obtain information from patient records
- Health care researchers
  - Obtain knowledge from the literature
- Medical students
  - Receive assistance for training
- Patients
  - Access understandable documentation

  - Francesco Grippo and Chiara Orsi (Italian data)
  - László Pelikán (Hungarian data)

# Coding Death Certificates for Health Statistics

Text classification: From the text of a certificate to one or more labels (codes)

Needed in about every country for public health statistics

SEE INSTRUCTIONS ON OTHER SIDE		27. PART I. Enter the diseases, injuries, or complications that caused the death. Do not enter the mode of dying, such as cardiac or respiratory arrest, shock, or heart failure. List only one cause on each line.				Approximate Interval Between Onset and Death:
IMMEDIATE CAUSE (Final disease or condition resulting in death) →		a. <u>Rupture of myocardium</u>				Mins.
Sequentially list conditions, if any, leading to immediate cause. Enter UNDERLYING CAUSE (Disease or injury that initiated events resulting in death) LAST		b. <u>Acute myocardial infarction</u>				6 days
		c. <u>Chronic ischemic heart disease</u>				5 years
		d.	DUE TO (OR AS A CONSEQUENCE OF):			
CAUSE OF DEATH		PART II. Other significant conditions contributing to death but not resulting in the underlying cause given in Part I.			28a. WAS AN AUTOPSY PERFORMED? (Yes or no)	28b. WERE AUTOPSY FINDINGS AVAILABLE PRIOR TO COMPLETION OF CAUSE OF DEATH? (Yes or no)
		<u>Diabetes, Chronic obstructive pulmonary disease, smoking</u>			Yes	Yes
29. MANNER OF DEATH <input checked="" type="checkbox"/> Natural <input type="checkbox"/> Pending Investigation <input type="checkbox"/> Accident <input type="checkbox"/> Could not be Determined <input type="checkbox"/> Suicide <input type="checkbox"/> Determined <input type="checkbox"/> Homicide		30a. DATE OF INJURY (Month, Day, Year)	30b. TIME OF INJURY	30c. INJURY AT WORK? (Yes or no)	30d. DESCRIBE HOW INJURY OCCURRED	
			M			
		30e. PLACE OF INJURY – At home, farm, street, factory, office building, etc. (Specify)	30f. LOCATION (Street and Number or Rural Route Number, City or Town, State)			

I23.3 Rupture of cardiac wall without haemopericardium as current complication following acute myocardial infarction (伴随急性心肌梗塞的无即期心包积血的心壁破裂)

I21.9 Acute myocardial infarction, unspecified (未明确的急性心肌梗塞)

I25.9 Chronic ischaemic heart disease, unspecified (未明确的慢性缺血性心脏病)

# Challenges

- Source language
  - Large **variation** in expression
  - **Context**-dependent coding
  - Spelling errors, abbreviations
- Target ontology
  - **Large number of target concepts** (> 3,000 disease codes)
  - Highly unbalanced examples
  - Concept labels use meta-language

# Methods: Supervised machine learning

- 'Pre-processing': **Normalize text** as much as possible
  - Spelling correction
  - Compound word normalization
  - Stemming
- Generate features:
  - **Text features**: token and character n-grams of normalized words
  - Predictions by lookup in pre-existing dictionary
  - **Structured data features**
    - Age of the deceased
    - Coding year
- Multi-label classification
  - SVM, one-vs-all

# Outcomes

## Top results on CLEF eHealth 2017 data

- English (US) death certificates
  - P=90, R=81, F=85
- French death certificates
  - P=89, R=77, F=83
- French death certificates, line-aligned
  - P=87, R=87, F=87

## Collaboration with users for take-up

- **CepiDc:** National epidemiology center on medical causes of death (WHO coding center)
  - Insert into coding workflow
- **Santé Publique France:** National public health agency
  - Detect “syndromic groups” for early outbreak surveillance and public health monitoring

# Pharmacovigilance from Social Media

## Objectives

## Spotting adverse drug event signals: pharmacovigilance, needed for drug safety

# Challenges

- Source language
  - Non-standard vocabulary
  - Lay vocabulary
  - Creative use of language on social networks
- Target ontology
  - Large number of target classes
  - MedDRA: > 22,000 sign and symptom (PT) codes

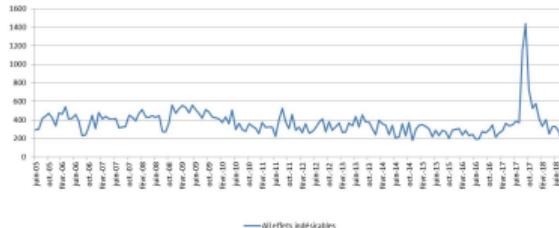

# Methods

- Large **terminology resources**: e.g., drug names
  - Collect based on UMLS semantic classes
- **Robustly learn to recognize non-standard vocabulary**
  - Word embeddings to collect non-standard variants
    - gynécologue, gynécolgue, gynécoloque, gynéco, gynécho, génico, gyné, gygy, etc.
  - Leverage syntactic parsing
    - Drug-taking verbs
    - I **take aspirin** every day
      - prendre, prescrire, être sous, donner, avoir...
    - Drug names absent from our lists
      - e.g., food complements, Canadian drug names
    - Intentional variants
      - Lévothyrox → lévo
      - Duphaston → dudu
      - pilule du lendemain → pdl
    - Spelling errors
  - **Supervised machine learning** for entity and relation detection

# Outcomes

## Example

- Analyzed 100 million posts
- Studies published by pharmacovigilance experts
  - Example: Baclophen study<sup>1</sup>
  - Example: Levothyrox study<sup>2</sup>
- Providing server to National Agency for Drug Safety

<sup>1</sup> Lillo-Le Louet A, et al. *Baclofen safety and its use in social media: a preliminary study*. International Society of Pharmacovigilance, Oct 2017

<sup>2</sup> Audeh B, Grouin C, Zweigenbaum P, Bousquet C, Jaulent MC, Benkebil M, Lillo-Le Louet A. *French Levothyrox® Crisis: Retrospective Analysis of French web forums dedicated to thyroid pathology*. International Society of Pharmacovigilance, Oct 2019

# Baclofen study

- 18570 posts mentioning baclofen and a clinical finding retrieved from NLP output database
  - Exclude alcohol dependence → 2621 posts
- Reviewed by two evaluators from pharmacovigilance center
  - 782 (29.2%) mentioned potential adverse drug reactions
- Compared to cases in French National Database
  - 717 ADR cases with baclofen
- Main findings
  - Information about baclofen dosage **more frequent in posts** (27.7% vs 9.2%)
  - 75% of the patients had a daily **dosage over 90 mg, higher** than the maximum recommended daily dosage
  - Demographic information (**gender, age**) **scarce** in posts

---

<sup>0</sup>Lillo-Le Louet A, et al. *Baclofen safety and its use in social media: a preliminary study.* International Society of Pharmacovigilance, Oct 2017

# Levothyrox study

First retrospective analysis of social media following a drug health crisis

- Levothyrox: used by 3 million patients in France
  - New Levothyrox formulation introduced in March 2017
- Examined all posts (900,000) published in the forums of the *Vivre sans thyroïde* Web site
- Posts mentioning Levothyrox or levothyroxine and a clinical finding were retrieved from NLP output database
  - Identified medical problems most mentioned with Levothyrox
  - Reviewed 100 most mentioned verbatims to create categories
  - Distribution and temporal evolution of problem categories

---

<sup>0</sup>Audeh B, Grouin C, Zweigenbaum P, Bousquet C, Jaulet MC, Benkebil M, Lillo-Le Louet A. *French Levothyrox® Crisis: Retrospective Analysis of French web forums dedicated to thyroid pathology*. International Society of Pharmacovigilance, Oct 2019

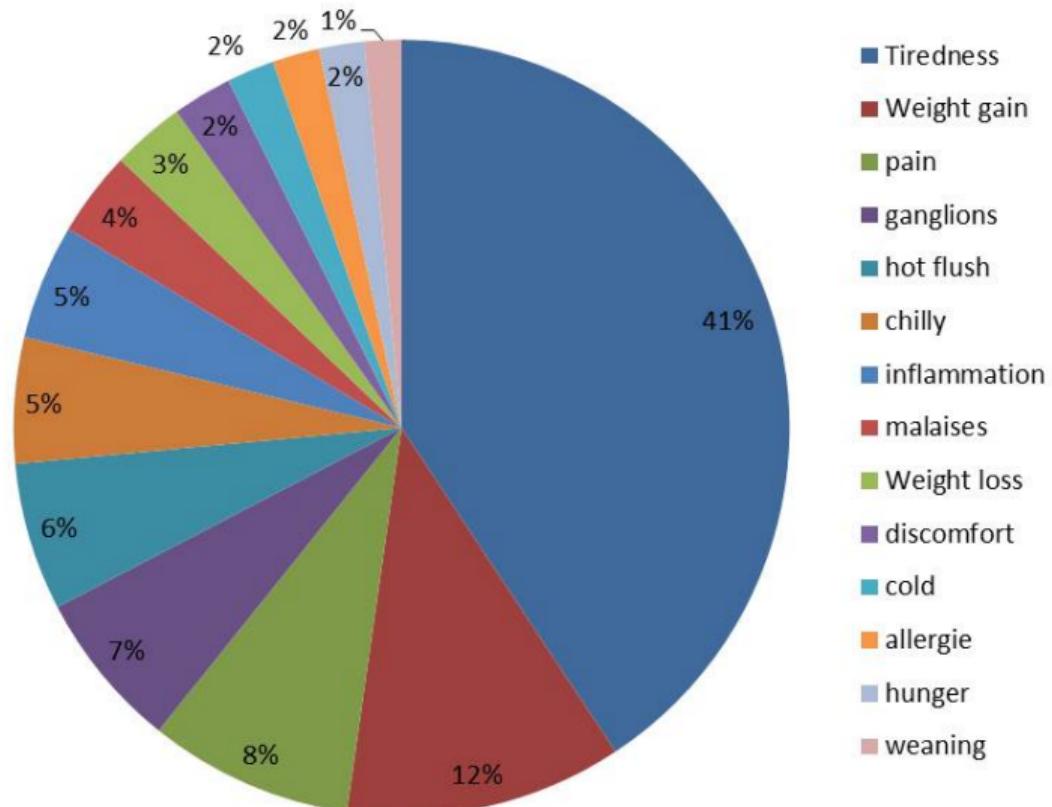

# Levothyrox: Distribution of problem categories

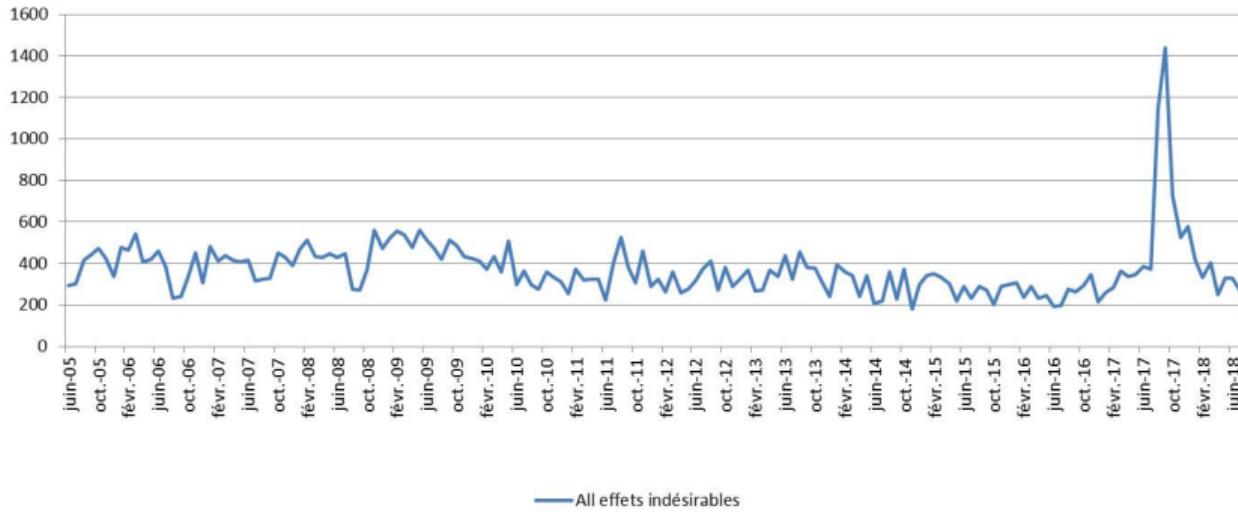

Problem Category	Examples	%
Drug Indication	<i>nodules, thyroid cancer</i>	25%
General event	<i>inflammation, tiredness</i>	25%
Neuro-psychiatric event	<i>depression, stress</i>	18%
Cardiovascular event	<i>hypertension, palpitation</i>	5%
Osteomuscular event	<i>cramps, osteoporosis</i>	
Gastrointestinal event	<i>nausea, constipation</i>	
Miscellaneous	<i>emergency, overdose</i>	
incl. Seriousness	<i>emergency, crisis</i>	7%

Abstract In English Chinese

To quantify transcriptional activity of NF-κB and to screen drugs related to the regulation of NF-κB activation, we constructed a recombinant plasmid through deleting the original CMV promoter of retrovirus vector pQCXIP and inserting the NF-κB enhancer and NanoLuc luciferase sequence into the vector. Then, using the recombinant plasmid we constructed a cell line in which the expression of NanoLuc luciferase (NLuc) was regulated by NF-κB. The inserted sequences were verified by restriction endonuclease digestion and sequencing. Tumor necrosis factor-α (TNF-α), an NF-κB activator, acted on the constructed NLuc cell line and led to the specific luciferase reaction. The luciferase reaction showed a time and dose dependence to the TNF-α stimulation, indicating the successful construction of the NF-κB regulated NLuc-expressing cell line. Besides, the NF-κB inhibitor, Iaptoide, reduced the expression of NLuc in a dose-dependent way. The constructed reporter system in this study could be applied in the quantification of the NF-κB transcriptional activity and in the NF-κB regulation-related drug screening.

KEYWORDS: NF-κB; NanoLuc luciferase; reporter gene system

Abstract In English Chinese

为了定量检测NF-κB的活性以及筛选与NF-κB活性调控相关的药物，通过去除逆转录病毒载体pQCXIP原有的CMV启动子，并分别插入NF-κB增容子序列及报告基因NanoLuc，构建了一种不含NF-κB增容子序列和NanoLuc (NLuc) 报告基因序列的表达载体，并进一步构建受NF-κB调节的稳定表达NLuc 荧光素酶的细胞系。酶切鉴定及测序结果表明成功构建了重组质粒pQCXIP-NF-κB-NLuc；NF-κB激活剂TNF-α作用于构建的稳定表达NLuc 荧光素酶的细胞系后能引起荧光素酶反应，且该反应与TNF-α的刺激成良好的时间、剂量依赖性；该结果表明此NF-κB 调节的稳定表达NLuc 荧光素酶的细胞系构建成功。实验验证中，NF-κB抑制剂Iaptoide对此稳定表达NLuc 荧光素酶表达的抑制剂量效应。综上，本实验构建的受NF-κB 调节的稳定表达NLuc 荧光素酶的报告基因系统可用于NF-κB的活化效率的定量检测及筛选与NF-κB活性相关的药物，具有研究和应用价值。

KEYWORDS: NF-κB; NanoLuc luciferase; reporter gene system

# WMT: Overview of the results for recurring language pairs (2016-2019)

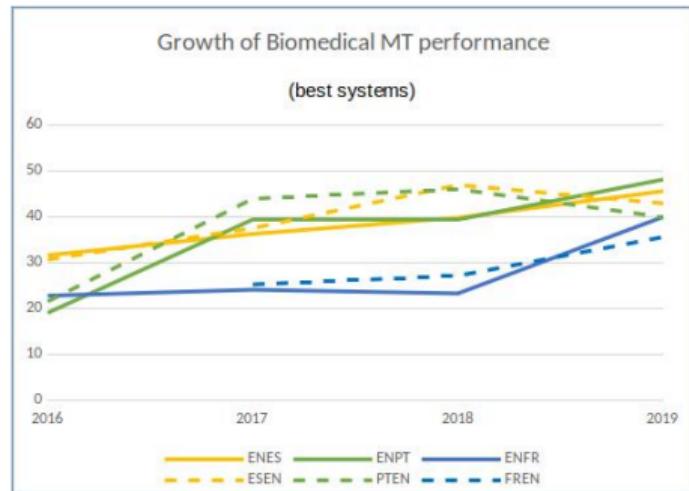

Indicative comparison, test sets were different each year

- Participation

- Up to 20 participating teams from up to 10 countries every year
- Includes teams with no speaker of the languages involved

- Material and Methods

- Participants increasingly rely on neural machine translation toolkits
- A wide variety of in-domain, out-of domain, monolingual and parallel corpora are used

# Contributions of the WMT biomedical task

see also: *Overcoming barriers to NLP for clinical text: the role of shared tasks and the need for additional creative solutions.* Chapman et al., J Am Med Inform Assoc. 2011 Sep-Oct;18(5):540-3

- Engage the scientific community on a specialized domain
  - Provide data to study translation in a specialized domain
  - Encourage general purpose translation
- Advance biomedical natural language processing
  - Increase availability and knowledge of biomedical data
  - Develop methods and understanding of NLP processes

# WMT 2020 EN-FR Machine Translation System

## Methods

- Sentence alignment: Microsoft bilingual aligner (Moore, 2002)
- Tokenization and Byte-pair encoding
  - M: Moses tools and subword-nmt
  - H: HuggingFace BERT API
- FT: Fine-tuning on MEDLINE abstracts and Cochrane corpora
- PT: Pre-translation of medical terms
  - French-English version of the MeSH thesaurus
  - 30k English terms + preferred French translation
  - Extended to 40k by extracting more MeSH term pairs occurring in the training corpus
  - Use the resulting sentence pairs in a second training phase
- Translation framework: seq-2-seq (Facebook's fairseq)
  - Basic Transformers
  - B: BERT-fused transformers (BERT-NMT)

# WMT 2020 EN-FR Machine Translation System

Results: BLEU=32.9–37.0

- Test sets: WMT 2018, 2019, 2020 (official)
- Adding additional corpora (1M sentences) to the provided corpora (2.9M sentences): improves BLEU score (+0.6–5.3 BLEU pt)
- Fine-tuning: always improves the Moses pipeline and the 2018 test set
- Back-translated monolingual corpora: small gain (+0.2–0.8 BLEU) for HuggingFace tokenization pipeline
- Pre-translation of medical terms: small drop (–0–0.8 BLEU)
  - The majority were already well translated
  - MeSH translations less similar to “natural” translations
- IR-selected additional corpora: improvement +0.5–0.9 BLEU for HuggingFace pipeline, +0.2–0.8 BLEU for BERT pipeline

# Drug Repurposing: Detection of Adverse Drug Reactions in Drug Labels

- Jingbo Xia  (HZAU), Pierre Zweigenbaum 
- Drug repurposing: finding novel uses of drugs
- Hypothesis
  - A cancer immunotherapy drug may induce adverse reactions through off-target protein interactions
  - If there is an identical side-effect phenotype between different drugs, it reveals that these drugs share a target
  - Analyzing the side-effects of drugs can reveal new targets for drug action
  - Entity detection helps collect adverse reactions from DailyMed drug labels
- Results
  - Here, suggests the BTK gene as an off-target site

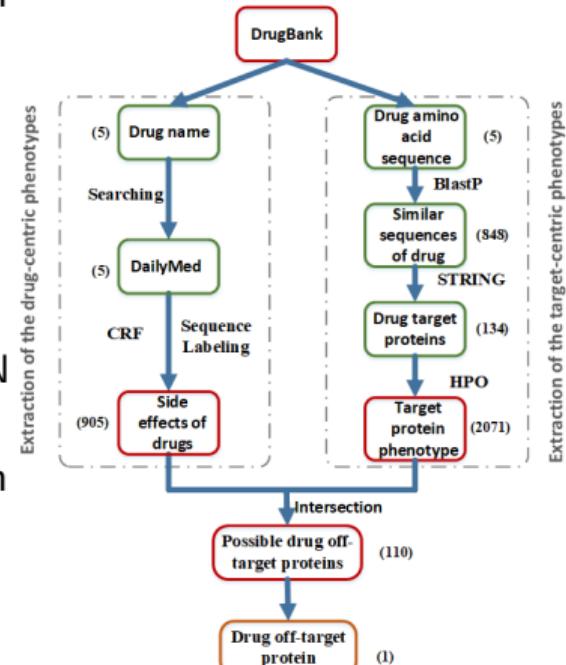

---

<sup>1</sup>Yuyu Zheng, Xiangyu Meng, Pierre Zweigenbaum, Lingling Chen, Jingbo Xia. Hybrid phenotype mining method for investigating off-target protein and underlying side effects of anti-tumor immunotherapy BMC Medical Informatics and Decision Making 2020, 20(Suppl 3):133 <https://doi.org/10.1186/s12911-020-1105-4>

# Entity Detection: a Component in a Larger Drug Repurposing Method

A hybrid phenotype mining method

- Select 5 monoclonal antibody drugs with similar mechanism
- Information Extraction
  - Train CRF **entity detection** on TAC 2017 ADR dataset
  - Use to extract adverse drug reactions from drug labels
- Find target proteins of these drugs and their phenotypes
  - Sequence similarity: find homologous amino acid sequences (BLAST)
  - Expand through protein-protein interaction network (STRING)
  - Obtain phenotype terms from Human Phenotype Ontology
- Select matching adverse drug reactions and phenotype term
  - Among 110 detected, investigated mutation of gene BTK
  - Gene Ontology analysis: filter genes with function related to T-cell proliferation activation, immune regulation
  - Results in 3 genes: AKT1, ACTG2, BTK, the latter more relevant according to a literature search

# A Virtual Patient to Train Medical Students

Je viens consulter pour une fatigue importante.  
Je suis épuisé

depuis quand ?

Je suis très fatigué depuis 7 mois

avez-vous d'autres symptômes ?

Plusieurs problèmes, j'ai des insomnies, je suis anxieux et j'ai mal au dos

dites m'en plus

Maintenant, j'ai perdu du poids et je n'ai plus de motivation

avez-vous été opéré ?

J'ai eu une opération de l'appendicite

quand ?

J'ai eu une opération de l'appendicite à 10 ans.

cela s'est bien passé ?

Non, il n'y a eu rien de particulier.

Prenez-vous un traitement ?

# A Virtual Patient to Train Medical Students

English version: D (Doctor) is the user input

P (Patient) sentences are generated by our system in real time

D: How are you feeling?

LEXICAL SIMPLIFICATION

P: Several things, I have **chest pain**, fever and sweating.

D: **And what else?**

PROCESSING INFORMATION STATE

P: I currently have a cough, yellow sputum and difficulty breathing.

D: Since when are you feeling **feverish**?

DERIVATIONAL VARIANTS

P: The fever started minutes after the pain.

INFLECTIONAL VARIANTS

D: Describe me your **coughing**.

P: I have a dry cough which started around 23 hs.

D: Are you **breathing with difficulty**?

MULTIWORD ENTITIES

P: Yes.

D: **Since when?**

ELLIPSIS

P: I have difficulty breathing since yesterday night.

D: Tell me more about your **sweating**.

TERM VARIATION

P: I **perspire** because of the fever.

D: Have you had chest pain for a long time?

P: I have had chest pain since yesterday evening at 20.

D: Are you allergic to something?

P: I am only allergic to kiwi

ANAPHORA

D: Do you have any treatment for **that**?

P: I do not take anything for my allergy.

D: Do you have a **cardiovascular disease**?

P: I have **hypertension**.

ONTOLOGICAL RELATIONS

D: Do you take a pill for your **tension problems**?

LEXICAL SIMPLIFICATION

P: I take an antihypertensive (**oral**).

TERM VARIATION

D: Have you ever been operated?

LEXICAL SIMPLIFICATION

P: I had an **appendix operation**.

AFFIXES

D: When did you have your **appendix** out?

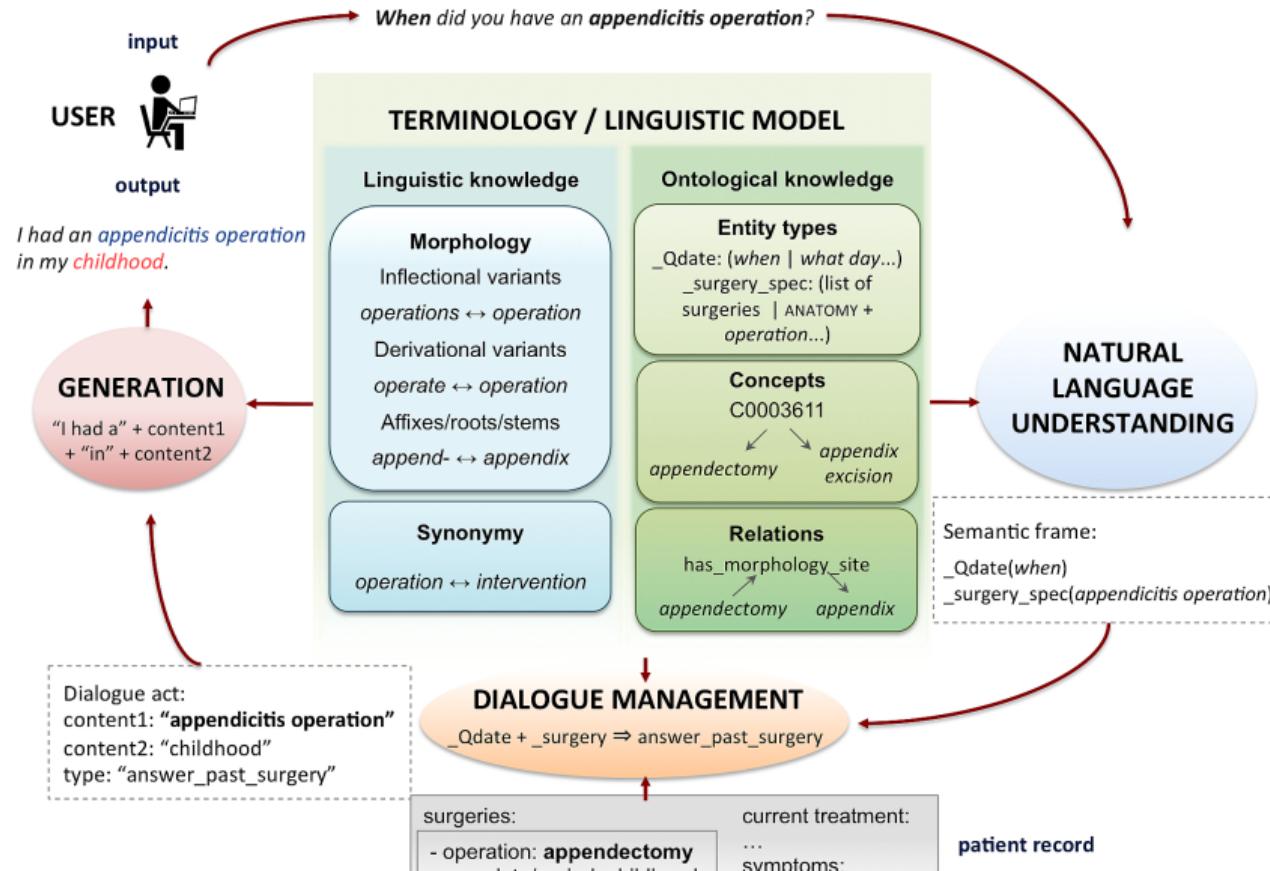

P: I had an appendix operation in my childhood.

# NLP challenges

- Terminology
  - Match user **vocabulary** to patient case vocabulary
  - Large concept and vocabulary spaces
- Includes question-answering
  - Need for **precision**
- Dialogue management
  - Context-based processing
  - Instantaneous answer
- Must run on **new specialties and cases with no human intervention**

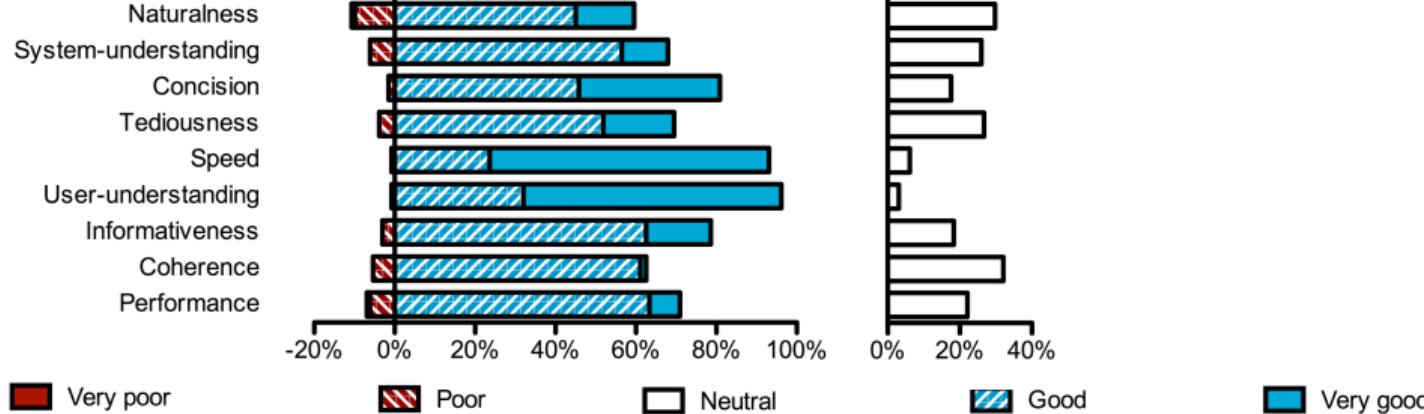

# System Architecture

# Outcomes

- Functional system
  - Good user evaluations

- Robust across medical specialties
- Robust on unseen patient cases

- Ready for transfer to company

# Mapping Word Embeddings to Concept Embeddings

Ontology : concept hierarchy

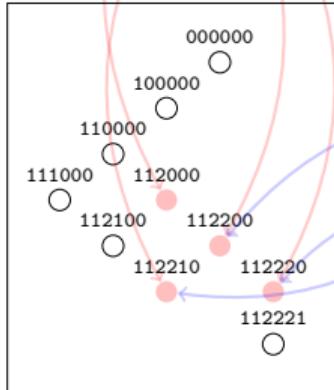

Text corpus

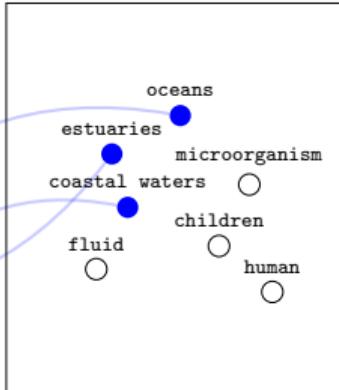

NC\_009456, NC\_009457, CP001235

Vibrios are facultatively anaerobic bacteria that are metabolically similar to the Enterobacteriaceae. They are ubiquitous in oceans, coastal waters, and estuaries. The best known species is *Vibrio cholerae*, which can cause severe diarrhoeal illness in humans. The genus *Vibrio* consists of Gram-negative straight or curved rods, motile by means of a single polar flagellum. They are capable of growth at temperatures from 10°C to 45°C. Classic cholera is characterized by an abrupt onset of vomiting and profuse watery diarrhea. Fluid losses can be significant (up to 20 Litres) and hypovolemic shock and metabolic acidosis can cause death within a few hours of onset, especially in children. Mortality, in severe cases, is as high as 50%. In the past 150 years, 7 pandemics were caused usually of *Vibrio cholerae* strains. A cholera epidemic originating in Indonesia in 1961 and moving to the Western hemisphere. In 1991, a cholera outbreak in Peru and 20 other countries in the Western hemisphere accounted for over 600,000 cases with 9000 deaths. The complete genome of *Vibrio cholerae* consists of three large chromosomes. The majority of recognizable genes for essential cellular functions, e.g., DNA repair, translation, transcription, and replication (e.g., toxin, surface antigen, and adhesin) are located on the large chromosome. The small chromosome contains a large percentage of hypothetical genes, more genes that appear to have origins other than the Proteobacteria and a gene capture system (gene transfer agent) that has been used to move genes between species and capture an ancestral *Vibrio* species. The *Vibrio cholerae* genome sequences provide a starting point for understanding how a free living, environmental microorganism is also a human pathogen. (from <http://www.ebi.ac.uk/ena/genomes/bacteria.html>) (Backlap)

Ontology embedding

Word embeddings

# C-Norm Methods

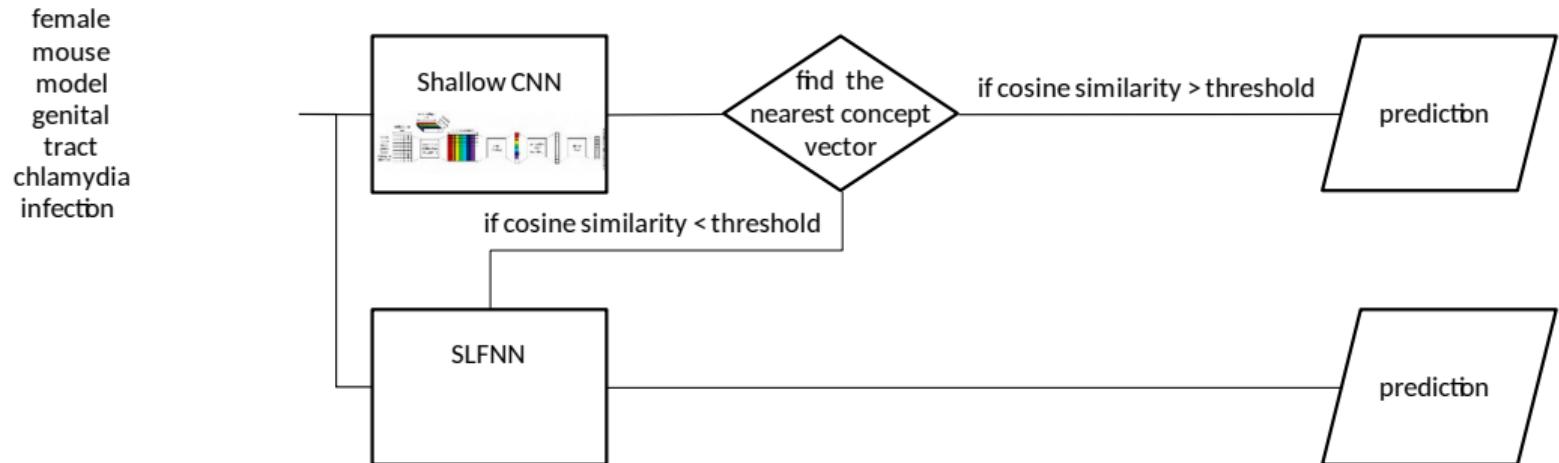

- Representation of words and concepts
  - Input: word2vec word embeddings
  - Output: ontology concept vectors
- Two entity linking methods
  - Single-layer feedforward neural network (SLFNN)
  - Shallow convolutional neural network CNN
  - Ensemble: Sieve, Average
- Ontology Embedding: Concept Vector Creation

- Funding: ANR project ADDICTE
- CharacterBERT: collaboration with Hiroshi Noji and Junichi Tsujii (AIRC, AIST)

# Pre-training vs Fine-tuning for a Specialized Domain

Should one pre-train BERT from scratch for a specialized domain?

- Typical procedure: use pre-trained model, resume pre-training on in-domain corpus, then fine-tune on task
- Would it be better to pre-train on in-domain corpus directly, with in-domain vocabulary?

Domain	Corpora	# of documents	# of words
General	Wikipedia (EN)	11,9 million	2,14 billion
	OpenWebText	3,15 million	1,28 billion
Medical	MIMIC-III	4,17 million	0,5 billion
	PubMed	4,65 million	0,5 billion

<sup>1</sup> Hicham El Boukkouri. Ré-entraîner ou entraîner soi-même ? Stratégies de pré-entraînement de BERT en domaine médical. In:

# Pre-training vs Fine-tuning for a Specialized Domain

Pre-training on medical corpus better; But if retraining on medical corpus, not much different. Better than BERT and BlueBERT

Model			Evaluation task			
V	C <sub>1</sub>	C <sub>2</sub>	i2b2/VA 2010	MEDNLI	ChemProt	DDI
general	general	∅	85,66 ± 0,18	77,31 ± 0,71	67,47 ± 0,99	75,81 ± 1,02

# WordPieces and Specialized Domains

- BERT and Transformer-based state of the art
  - use WordPiece tokenization
- Specialized models (e.g., BioBERT, BlueBERT)
  - resume pre-training from general domain
  - keep general-domain WordPiece vocabulary

---

<sup>1</sup> Hicham El Boukkouri, Olivier Ferret, Thomas Lavergne, Hiroshi Noji, Pierre Zweigenbaum, Junichi Tsujii. **CharacterBERT: Reconciling ELMo and BERT for Word-Level Open-Vocabulary Representations From Characters.** COLING 2020

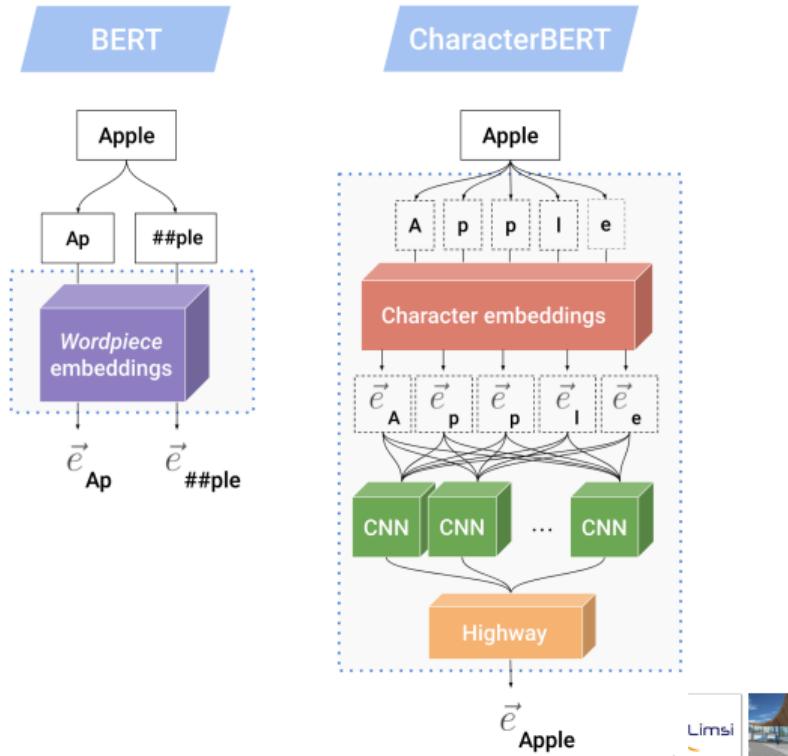

# WordPieces: Related Issues

- WordPieces can be inconvenient
  - multiple vectors for unknown tokens
  - word similarity tasks: aggregation issue
  - sequence labeling tasks: only label first wordpiece
- General WordPieces not suited for specialized domains
  - [para, ce, tam, ol]
  - [cho, led, och, oli, thi, asi, s]
  - [bo, rb, ory, gm, i]

# CharacterBERT: a Word-based BERT

Character-CNN module like ELMO

- No wordpieces
- Character-level
- 1 token = 1 embedding
- Open-vocabulary
- Whole-word masking for free

# CharacterBERT: Pre-training Corpora

## General and Medical corpora

<b>Corpus</b>	<b>Composition</b>	<b># documents</b>	<b># tokens</b>
General	Wikipedia (EN)	$5.99 \times 10^6$	$2.14 \times 10^9$
	OpenWebText	$1.56 \times 10^6$	$1.28 \times 10^9$
Medical	MIMIC-III	$2.09 \times 10^6$	$0.51 \times 10^9$
	PMC OA abstracts	$2.33 \times 10^6$	$0.52 \times 10^9$

General : train on general corpus

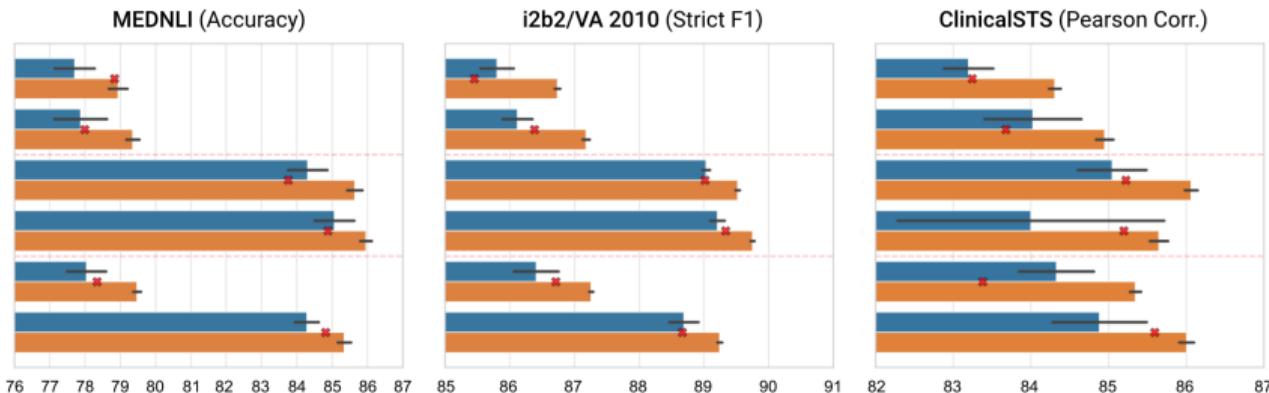

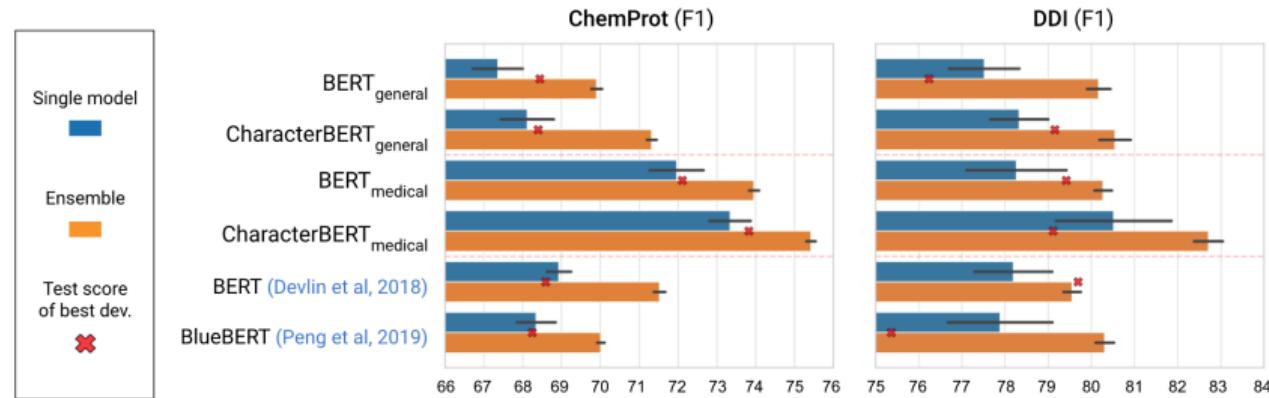

Medical : re-train general on medical corpus

# CharacterBERT: Evaluation

- Five tasks
  - Entity detection: i2b2/VA 2010
  - Relation Extraction: ChemProt and DDI
  - Natural Language Inference: MEDNLI
  - Text similarity: ClinicalSTS
- 10 random seeds / 15 training epochs / keep best on validation set
  - Final performance: avg+/- std on test set
  - Ensemble performance: majority vote; avg. score for STS

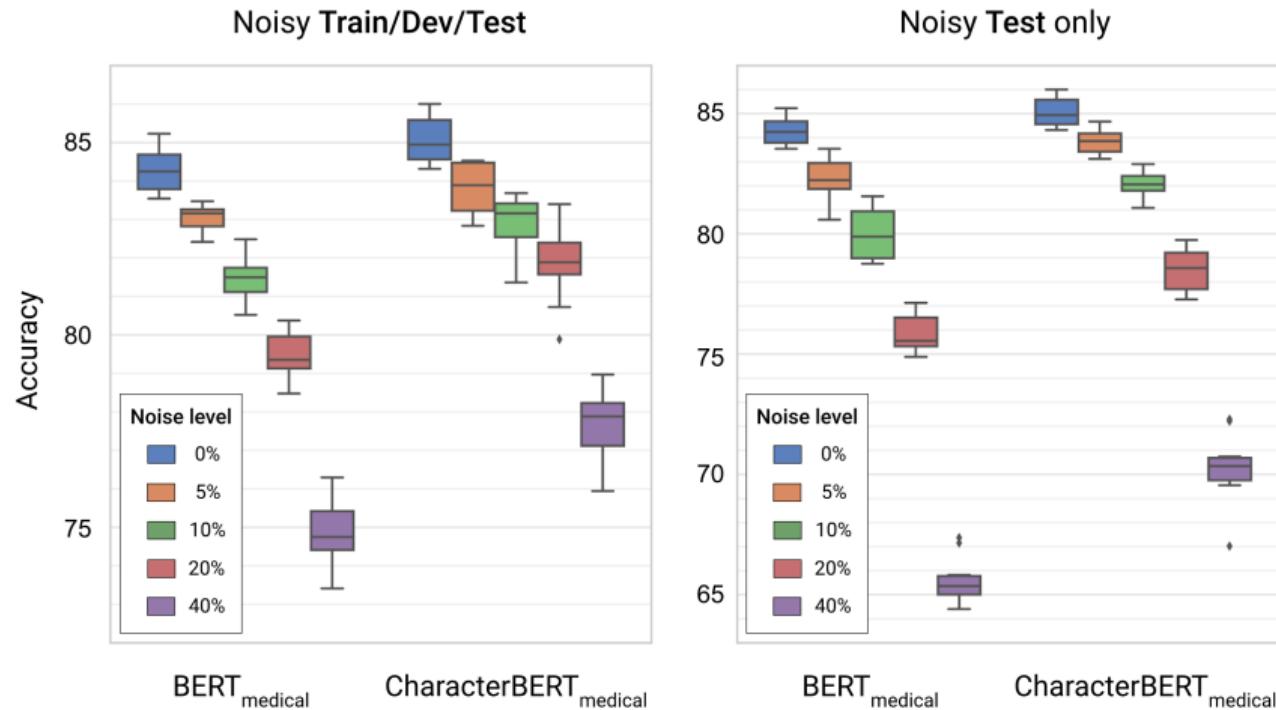

# CharacterBERT: Results

Overall better performance from CharacterBERT

# CharacterBERT: Robustness to Noise

Improved robustness to noisy versions of MEDNLI test

# CharacterBERT: Conclusion

- Drops wordpiece system altogether
- Produces open-vocabulary representations by consulting a token's characters
- Globally outperforms BERT when specialized for medical domain
- More robust to misspellings

## 4 TAL pour les étudiants en médecine

- Dialogue personne-machine pour entraîner les étudiants en médecine

## 5 Textes biomédicaux pour chercheurs en TAL

- Création de corpus de textes biomédicaux

## 6 Plongements lexicaux en domaine spécialisé

- Plongement d'ontologie pour le liage référentiel

# Conclusion: Traitement automatique des langues pour la santé

- Extraction d'information
  - dans des textes cliniques
  - dans les médias sociaux
  - dans les publications scientifiques
- Dialogue en langue naturelle
  - avatar dialogant pour la formation des étudiants en médecine
- Liage à des sources de connaissances pré-existantes
  - dans les certificats de décès pour les statistiques (inter)nationales
  - dans les certificats de décès pour la surveillance syndromique réactive
- Traduction automatique
  - pour faciliter l'accès à des publications dans des langues diverses
  - ... simplification de texte
- Méthodes hybrides qui prennent en compte les connaissances existantes
  - plongement d'ontologie pour le liage référentiel
  - dictionnaires etc. dans les méthodes supervisées
- Plongements de mots et de concepts spécialisés

Merci !
